

SPECjbb2005 performance and power consumption on Intel Xeon 51xx processor-based servers

Executive summary

Intel Corporation (Intel) commissioned Principled Technologies (PT) to measure the SPECjbb2005 performance of dual-processor servers using the following four processors:

- Dual-Core Intel Xeon processor 5110
- Dual-Core Intel Xeon processor 5130
- Dual-Core Intel Xeon processor 5150
- Dual-Core Intel Xeon processor 5160

SPECjbb2005 is an industry-standard benchmark created by the Standard Performance Evaluation Corp. (SPEC) to measure a server's Java performance. SPEC modeled SPECjbb2005 on the three-tier client/server architecture, with the middle layer as the primary focus. Per SPEC.

"Random input selection represents the first (user) tier.

SPECjbb2005 fully implements the middle tier business logic. The third tier is represented by tables of objects, implemented by Java Collections, rather than a separate database."

(www.spec.org/jbb2005/docs/UserGuide.html).

SPECjbb2005 utilizes multiple special data groups and multiple threads as it runs. Each data unit is a "warehouse", which is a roughly 25MB collection of data objects. Each thread represents an active user posting transaction requests within a warehouse. The benchmark run begins with one warehouse and then increases the number of warehouses; its goal is to saturate the server's processor capacity. As the number of warehouses increases, so does the number of threads. The benchmark's results portray the server's throughput in bops (business operations per second). Because bops is a rate, a higher number of bops is better. (For more information on SPECjbb2005, go to www.spec.org.)

KEY FINDINGS

- The Dual-Core Intel Xeon processor 5160-based server delivered 55 percent higher peak performance than the Dual-Core Intel Xeon processor 5110-based server (see Figure 1).
- The Dual-Core Intel Xeon processor 5160-based server delivered almost 10 percent more performance/watt than the Dual-Core Intel Xeon processor 5110-based server (see Figure 2). (We calculated performance/watt using system-level power measurements.)

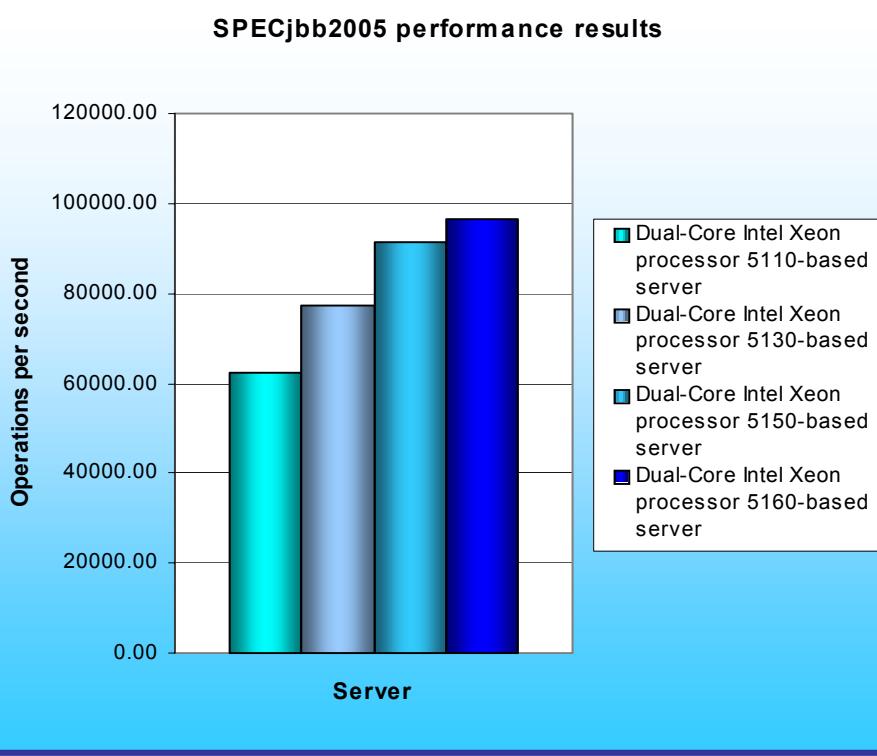

Figure 1: SPECjbb2005 business operations per second (dual-processor) results for the test servers. Higher numbers of operations per second are better.

In this section, we discuss the best results for each server. For complete details of the performance of each server with varying thread counts, see the "Test results" section.

Figure 1 shows the SPECjbb2005 results, in bops, of the four test servers. Each result is the median peak score of three runs of the benchmark. See the “Test Results” section for the scores from all three runs. A higher SPECjbb2005 score indicates the server is able to handle more Java requests and thus deliver greater throughput.

The Dual-Core Intel Xeon processor 5160-based server produced the highest result: 96,494 bops. The Dual-Core Intel Xeon processor 5150-based server achieved 91,315, while the Dual-Core Intel Xeon processor 5130-based server produced a score of 77,233 bops. The Dual-Core Intel Xeon processor 5110-based server produced a score of 62,174 bops. The Dual-Core Intel Xeon processor 5160-based server thus delivered a 55.2 percent performance increase over the Dual-Core Intel Xeon processor 5110-based server and a 24.9 percent increase over the Dual-Core Intel Xeon processor 5130-based server. The Dual-Core Intel Xeon processor 5160-based server produced 5.7 percent performance increase over the Dual-Core Intel Xeon processor 5150-based server.

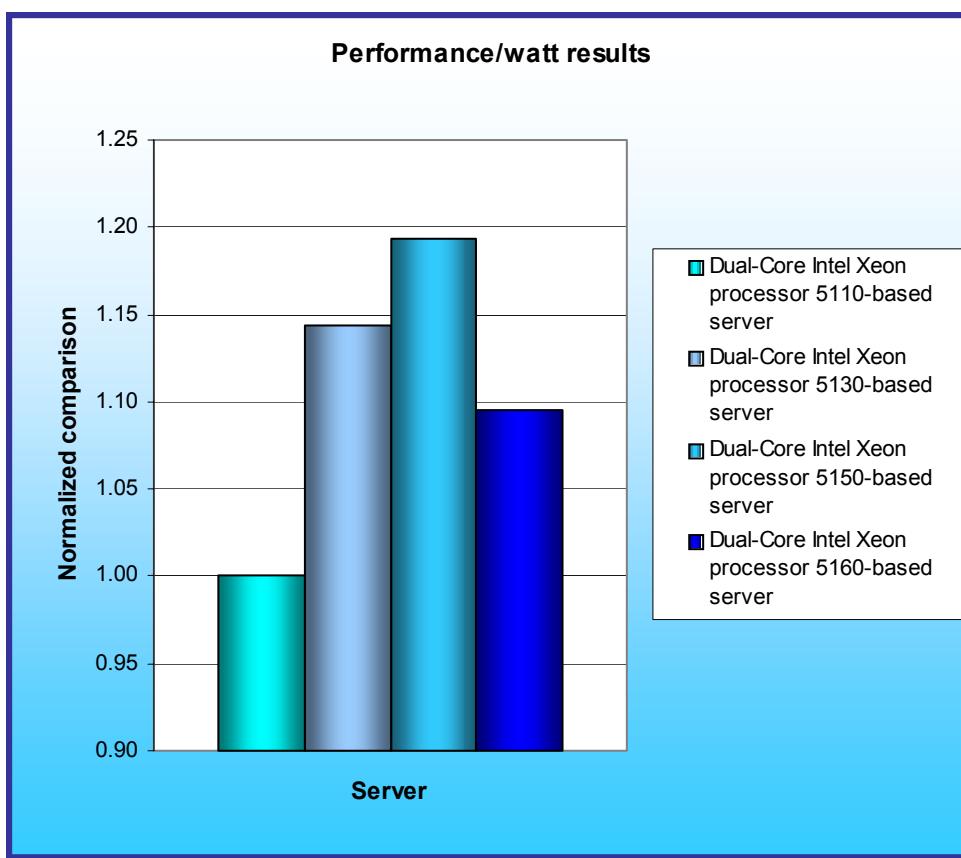

Figure 2: Performance/watt (dual-processor) results of the test servers running SPECjbb2005. Higher numbers indicate better performance/watt.

As Figure 2 illustrates, the Dual-Core Intel Xeon processor 5160-based server delivered over 9 percent more performance/watt than the Dual-Core Intel Xeon processor 5110-based server.

Figure 3 shows a plot of the power usage of the four servers as they were running the benchmark. The red lines indicate the power measurement interval, the time during which the server was delivering peak performance and during which we captured power measurements. Lower power consumption is better.

Figure 2 illustrates the performance/watt for each of the four servers. In this chart, we normalized the results for each system to the lowest performance/watt configuration. The lowest system's performance/watt result is thus always 1.00. By normalizing, we make each data point in these charts a comparative number, with higher results indicating better performance/watt.

To calculate the performance/watt we used the following formula:

$$\text{Performance/watt} = \text{the benchmark's score} / \text{average power consumption in watts during the time period in which the benchmark was delivering peak performance.}$$

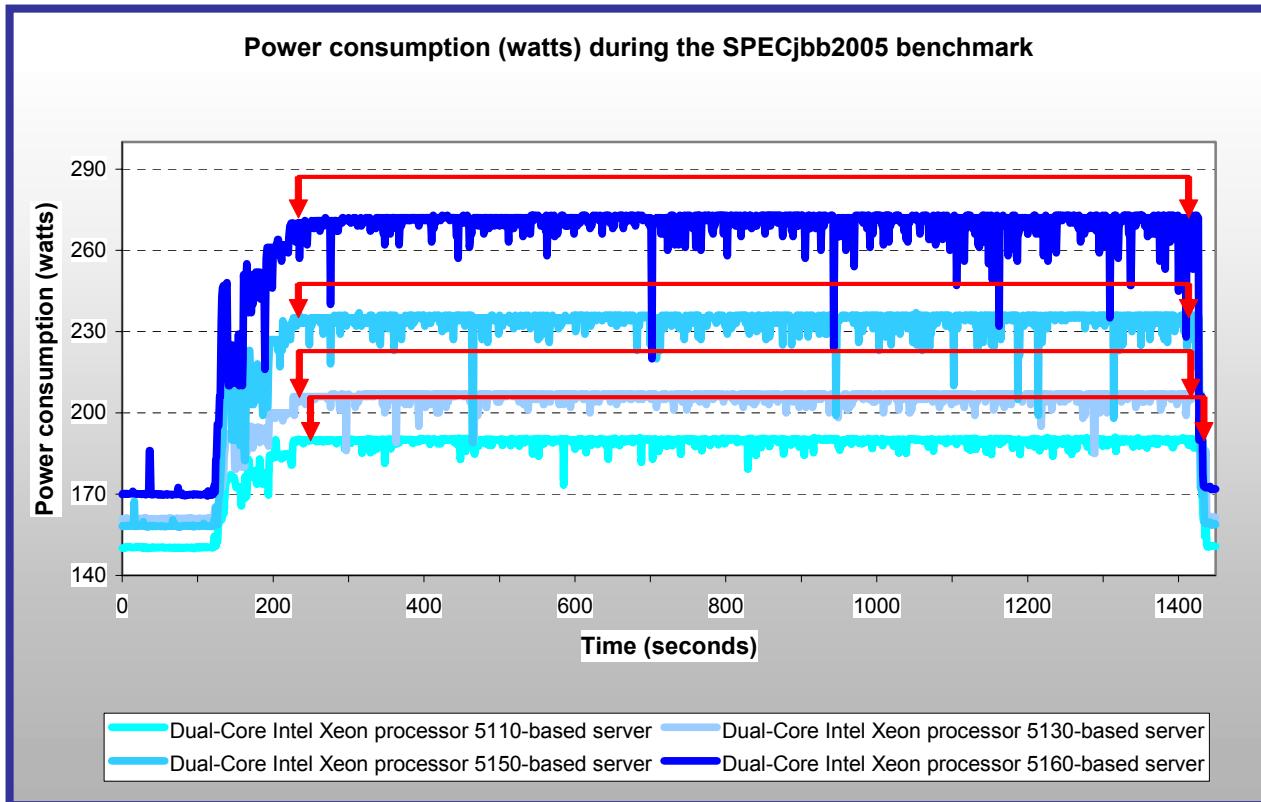

Figure 3: Power consumption (in watts) of each of the servers throughout the course of executing the SPECjbb2005 benchmark. Lower power consumption is better.

Test results

Figure 4 shows the median SPECjbb2005 results for all four servers. SPECjbb2005 computes its score by taking the average of the results during mixes when the server is running at peak performance. In our testing, all servers achieved peak performance during mixes 4 through 8. (In SPEC's terms, these results are from "compliant" runs, which means we can disclose them publicly though we are not posting them on the SPEC Web site with all the SPEC required files. We do present here all the data necessary to reproduce these results.)

Warehouse	Operations per second			
	Dual-Core Intel Xeon processor 5110-based server	Dual-Core Intel Xeon processor 5130-based server	Dual-Core Intel Xeon processor 5150-based server	Dual-Core Intel Xeon processor 5160-based server

Higher numbers are better.

Figure 9 details the power consumption, in watts, of the test servers while idle and during the median peak runs of the benchmark.

Server	Idle power (watts)	Average power (watts)
Dual-Core Intel Xeon processor 5110-based server	150.3	188.4
Dual-Core Intel Xeon processor 5130-based server	160.9	204.7
Dual-Core Intel Xeon processor 5150-based server	158.3	231.9
Dual-Core Intel Xeon processor 5160-based server	170.3	266.9

Figure 9: Average power usage (in watts) of the test servers during the median peak runs of SPECjbb2005. Lower numbers are better.

Test methodology

We began by installing a fresh copy of Microsoft Windows 2003 Server, x64 Enterprise Edition Service Pack 1 on each server. We followed this process for each installation:

1. Assign a computer name of “Server”.
2. For the licensing mode, use the default setting of five concurrent connections.
3. Enter a password for the administrator log on.
4. Select Eastern Time Zone.
5. Use typical settings for the Network installation.
6. Use “Testbed” for the workgroup.

We applied the following updates from the Microsoft Windows Update site:

- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB921398)
- Windows Server 2003 Security Update for Outlook Express for Windows Server 2003 x64 Edition (KB920214)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB917422)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB922616)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB920683)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB920670)
- Windows Server 2003 Cumulative Security Update for Internet Explorer for Windows Server 2003 x64 Edition (KB918899)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB921883)

- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB917159)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB914388)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB911280)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB917953)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB918439)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB917344)
- Windows Server 2003 Update for Windows Server 2003 x64 Edition (KB914784)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB914389)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB917734)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB911562)
- Windows Server 2003 Cumulative Security Update for Outlook Express for Windows Server 2003 x64 Edition (KB911567)
- Windows Server 2003 Security Update for Windows Media Player Plug-in (KB911564)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB911927)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB908519)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB912919)
- Windows Server 2003 Update for Windows Server 2003 x64 Edition (KB910437)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB896424)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB900725)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB902400)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB904706)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB901017)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB890046)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB899587)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB899591)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB893756)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB899588)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB901214)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB896358)
- Windows Server 2003 Security Update for Windows Server 2003 x64 Edition (KB896428)
- Windows Server 2003 Update for Windows Server 2003 x64 Edition (KB898715)

To improve Java performance, we enabled large pages in memory on all servers. To enable this service, the administrator must first assign additional privileges to the user who will be running the application. We assigned this privilege only to the administrator, because we used that account for our tests. To enable large pages, we did the following:

- Select Control Panel -> Administrative Tools -> Local Security Policy.
- Select Local Policies -> User Rights Assignment.
- Select “Lock pages in memory”, add users and/or groups.

Power measurement procedure

To record each server's power consumption during each test, we used an Extech Instruments (www.extech.com) 380803 Power Analyzer / Datalogger. We connected the power cord from the server under test to the Power Analyzer's output load power outlet. We then plugged the power cord from the Power Analyzer's input voltage connection into a power outlet.

We used the Power Analyzer's Data Acquisition Software (version 2.11) to capture all recordings. We installed the software on a separate Intel-processor-based PC, which we connected to the Power Analyzer via an RS-232 cable. We captured power consumption at one-second intervals.

To gauge the idle power usage, we recorded the power usage for two minutes while each server was running the operating system but otherwise idle.

We then recorded the power usage (in watts) for each server during the testing at one-second intervals. To compute the average power usage, we averaged the power usage during the time the server was producing its peak performance results. We call this time the power measurement interval. See Figures 3 (power consumption over time) and 8 (idle and average peak power) for the results of these measurements.

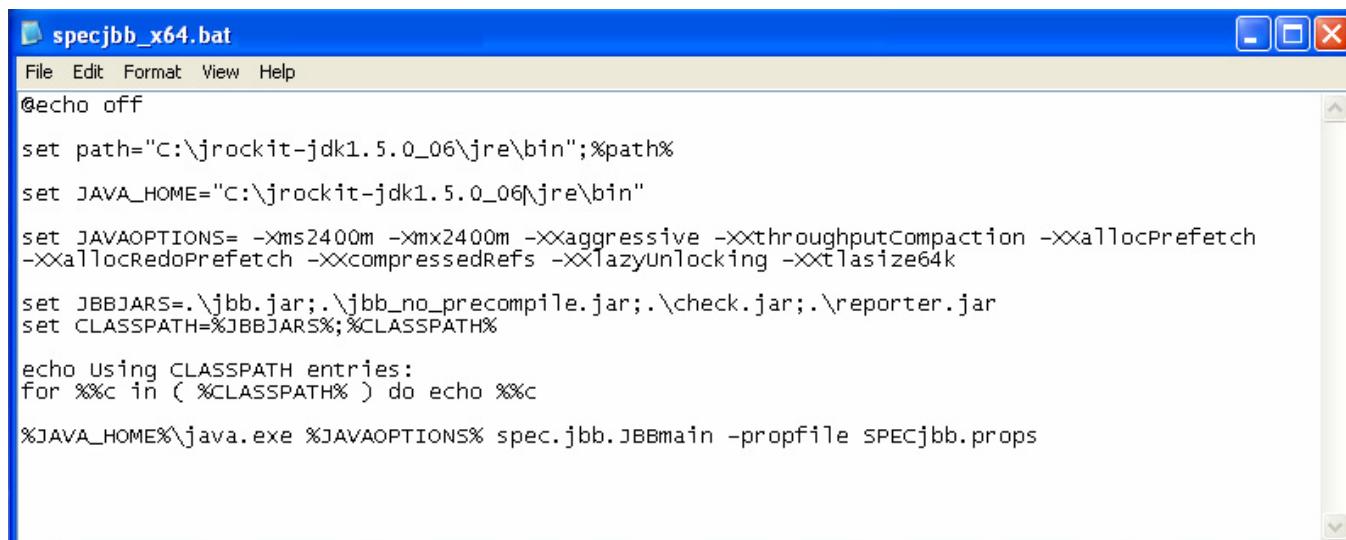

SPECjbb2005 configuration

We used SPECjbb2005 version 1.07, dated March 15, 2006. We followed SPEC's run rules. (For more information about SPECjbb2005 and its run rules, see www.spec.org/jbb2005/docs/RunRules.html.) We installed SPECjbb2005 by copying the contents of the SPECjbb2005 CD to the directory C:\Documents and Setting\Administrator\SPECjbb2005v1.07 on the server's hard disk.

SPECjbb2005 requires a Java Virtual Machine (JVM) on the system under test. We used the BEA JRockit 5.0 (P26.4.0-10-62459-1.5.0_06-20060529-2101-win-x86_64 for Microsoft Windows) JVM for this testing and left the default installation settings.

After installation, as per the run rules we edited the SPECjbb_config.props file in the root SPECjbb2005 directory to include disclosure information about the server and our license information. SPECjbb2005 uses this file when generating the results output for each run.

We created a batch file, which we placed in the root SPECjbb2005 directory, to issue the Java run command to launch the benchmark. During testing, we used the command prompt window within Microsoft Windows Server 2003 x64 Edition to run this batch file. Figure 10 shows the contents of this file.

```
specjbb_x64.bat
File Edit Format View Help
@echo off
set path="c:\jrockit-jdk1.5.0_06\jre\bin";%path%
set JAVA_HOME="C:\jrockit-jdk1.5.0_06\jre\bin"

%JAVA_HOME%\java.exe %JAVAOPTIONS% spec.jbb.JBBmain -propfile SPECjbb.props
```

Figure 10: The text of the batch file we used to execute the SPECjbb2005 benchmark on all servers.

In the batch file we used the “set JAVAOPTIONS” command to set the Java options that control the performance of the JVM. Intel specified the following Java option settings:

- *-Xms2400m* This option sets the minimum heap size. We set the minimum and maximum heap sizes to be the same, so the heap size would stay a constant 2400MB.
- *-Xmx2400m* This option sets the maximum heap size.
- *-XX:aggressive* This option basically tells the JVM to perform at maximum speed.
- *-XX:throughputCompaction* This option adjusts the compaction ratio dynamically based on live data in the heap.

- `-XXallocPrefetch` This option tells the JVM to prefetch a chunk of data when it uses a related, earlier bit of data.
- `-XXallocRedoPrefetch` This option also affects JVM prefetch behavior.
- `-XXcompressedRefs` This option turns on compressed references.
- `-XXlazyUnlocking` This option affects when the JVM releases locks.
- `-XXtlasize64k` This option sets the thread-local area size the JVM uses.

Appendix A – Test server configuration information

This appendix provides detailed configuration information about each of the four test server systems, which we list in alphabetical order.
